Don't hide expression after pressing Enter #653

Problem Statement
Calculator has this nice display that shows the expression that is about to be calculated.

Upon pressing Enter, the expression disappears.

Wouldn't it be nice to know what that expression was after pressing Enter?

Evidence or User Insights
Personal anecdote: I often have to re-enter computations because I'm worried that I might have made a typo, and there's no way to tell.

Proposal
In Standard, Scientific, and Programmer modes, keep the expression display visible after user presses Enter. The expression display ends in "=".
After pressing Enter, further operations cause the expression display to start with the value from the result display, as it does today.

Goals
User can determine expression that was entered after entering it.

Non-Goals
Expression display will continue to be non-editable.

Low-Fidelity Concept

Requested Assignment

I'm just suggesting this idea. I don't want to implement it.

This is your friendly Microsoft Issue Bot. I've seen this issue come in and have gone to tell a human about it.

This pitch looks like it has everything it needs for review. In the meantime, we'll keep this idea open for discussion so the community has the chance to provide feedback. Check out our New Feedback Process for more info on the user-centered process we follow for new feature development.

We reviewed the pitch and would love to move forward with it! Since the idea is fairly straightforward and is entirely captured by the proposal, we can move this straight into production. **@carlreinke**, since you mentioned you don't want to implement this, I am going to open it up to the community. Thanks again for your contribution!
